

SIEMENS

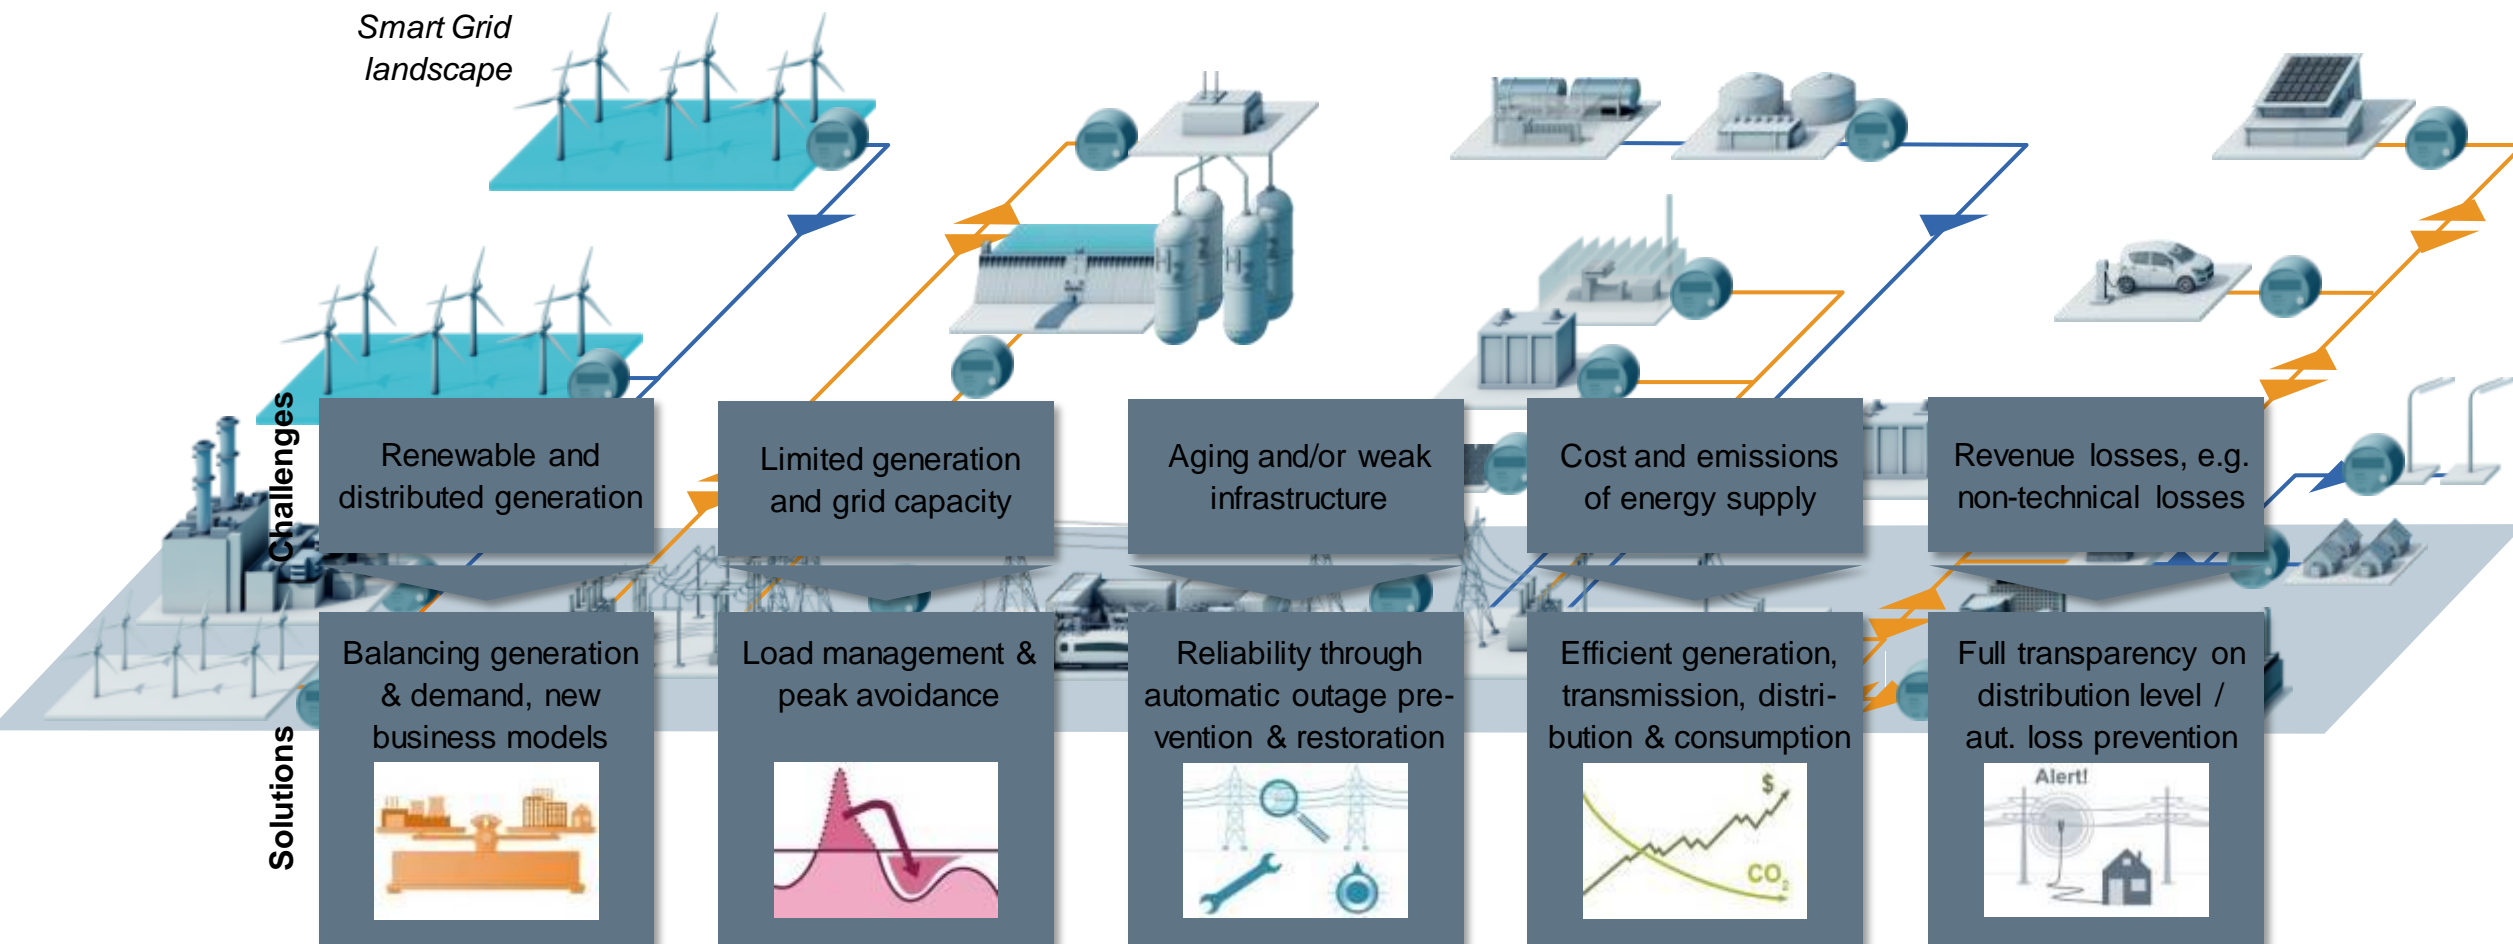

The Smart Grid - Constant Energy in a World of Constant Change

Energy meets Intelligence

... require a new Smart Grid infrastructure

*Future
Smart Grid
landscape*

Challenges

Solutions

Renewable and distributed generation

Limited generation and grid capacity

Aging and/or weak infrastructure

Cost and emissions of energy supply

Revenue losses, e.g. non-technical losses

Balancing generation & demand, new business models

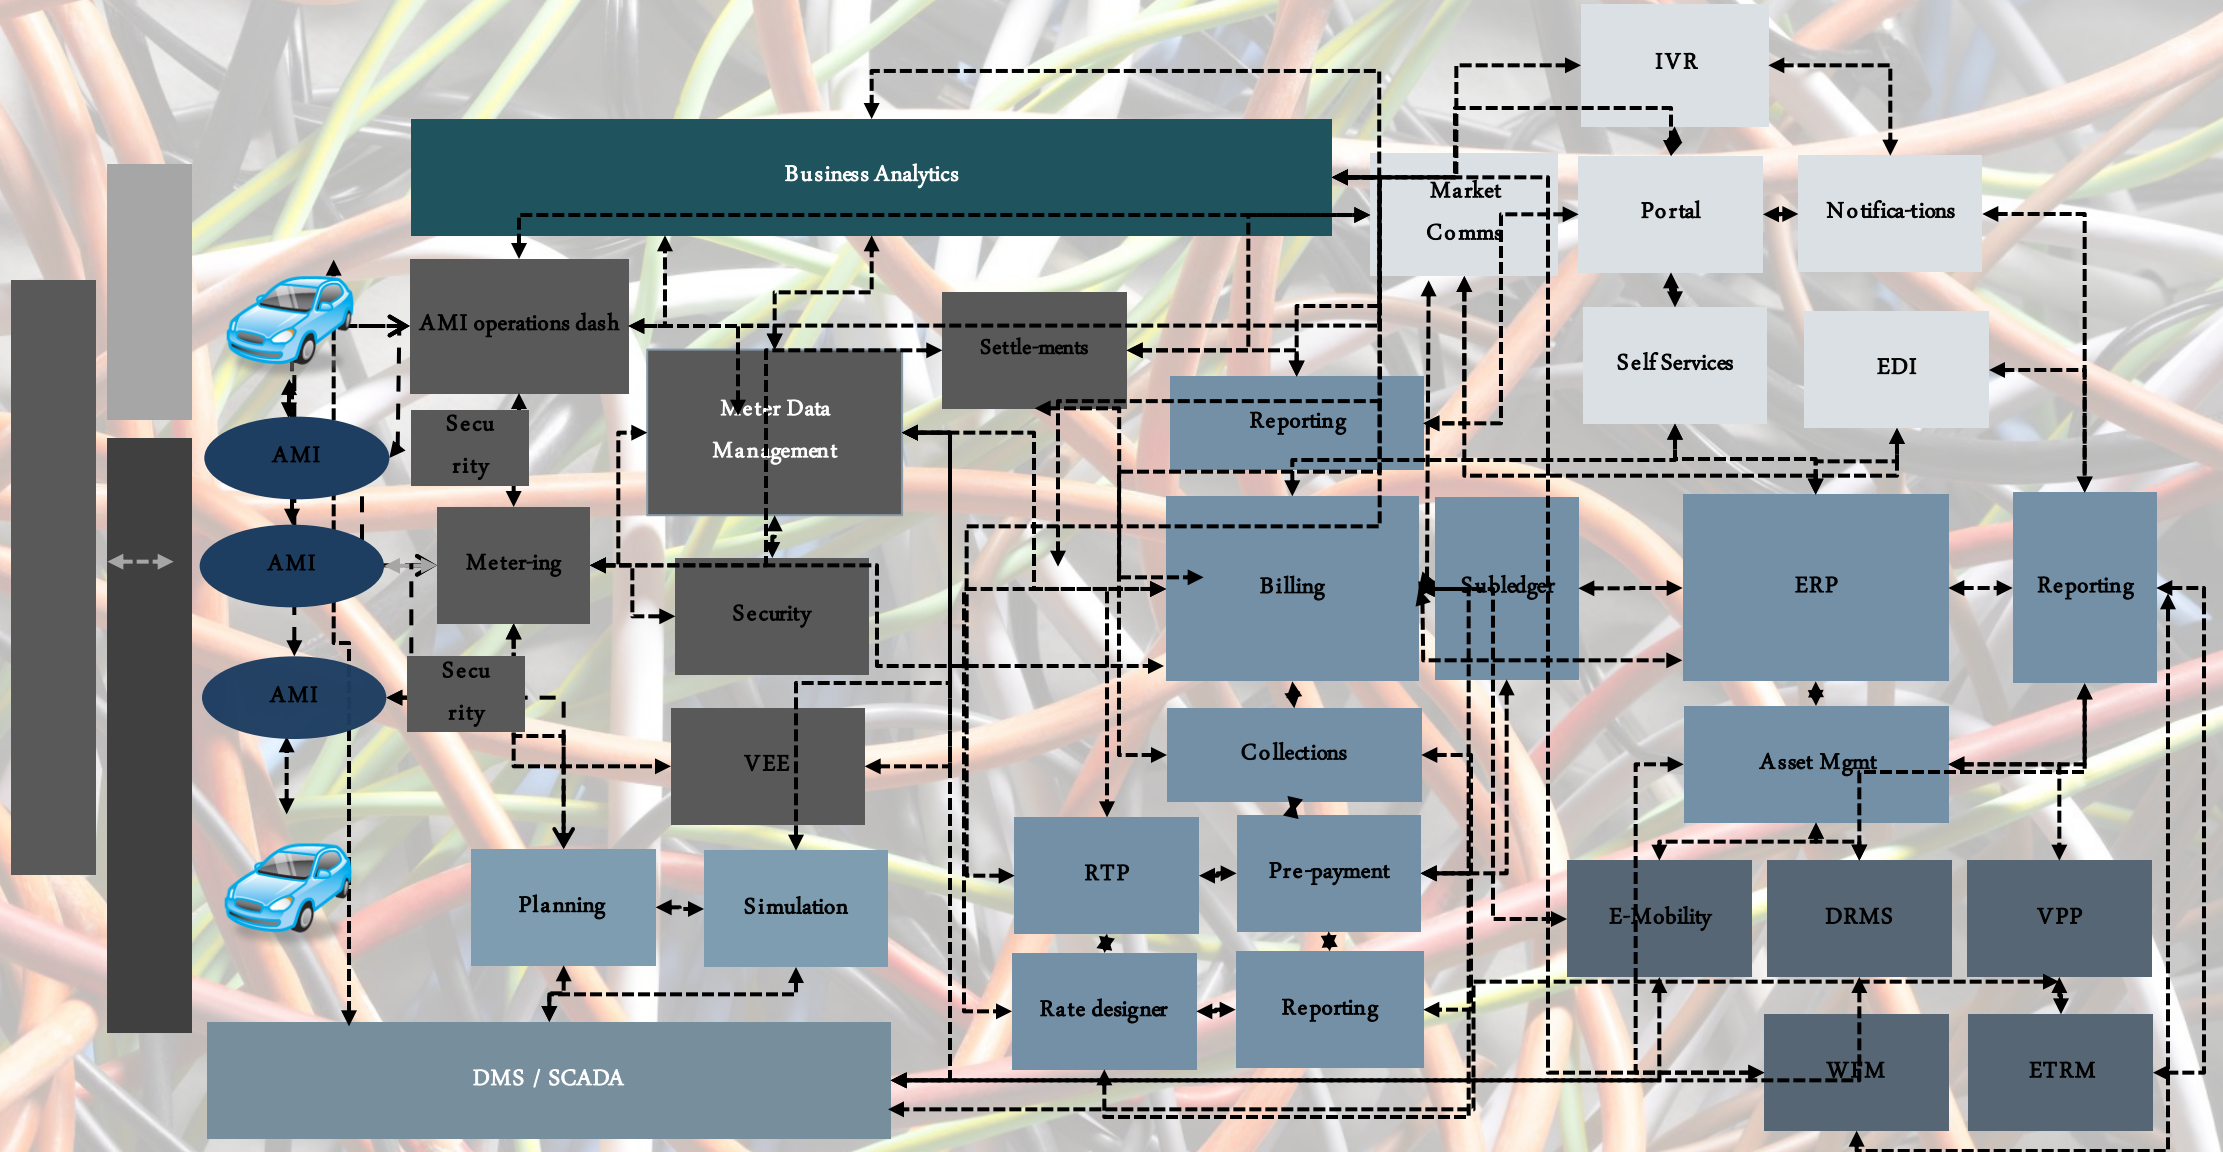

Load management & peak avoidance

Reliability through automatic outage prevention & restoration

Efficient generation, transmission, distribution & consumption

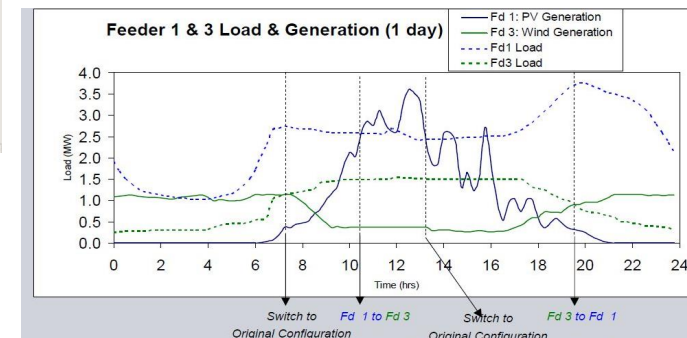

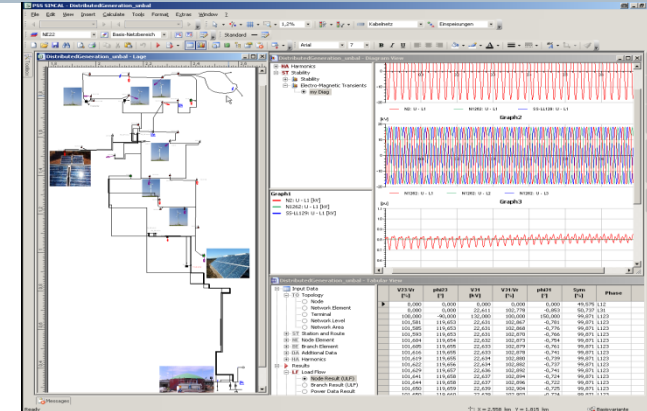

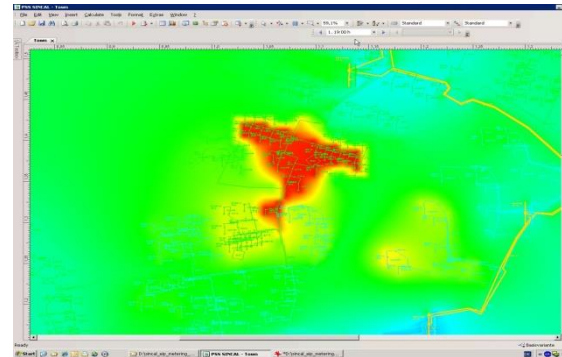

Full transparency on distribution level / aut. loss prevention

Adding application on application and silo thinking will lead us to infeasible complexity

Why Connecting Metering Information to Network Analysis

- ▶ Understand the actual networks and evaluate specific events (post mortem)
- ▶ Improve long term network planning based on profile data for loads and generators
- ▶ Develop more suitable „standard profiles“ for utility-specific clusters of customers.
- ▶ Recognize different trends in the network at an early stage
- ▶ Support „Operation Planning“ :
 - ▶ Influence the network configuration based on the actual situation
 - ▶ Optimize the loading of elements due to the conditions of the last period
 - ▶ Shift investments to a later date

Existing Analytical Applications

Modeling New Rate Programs

Outage Analysis

Event Tracking and Trending

Load Profiling

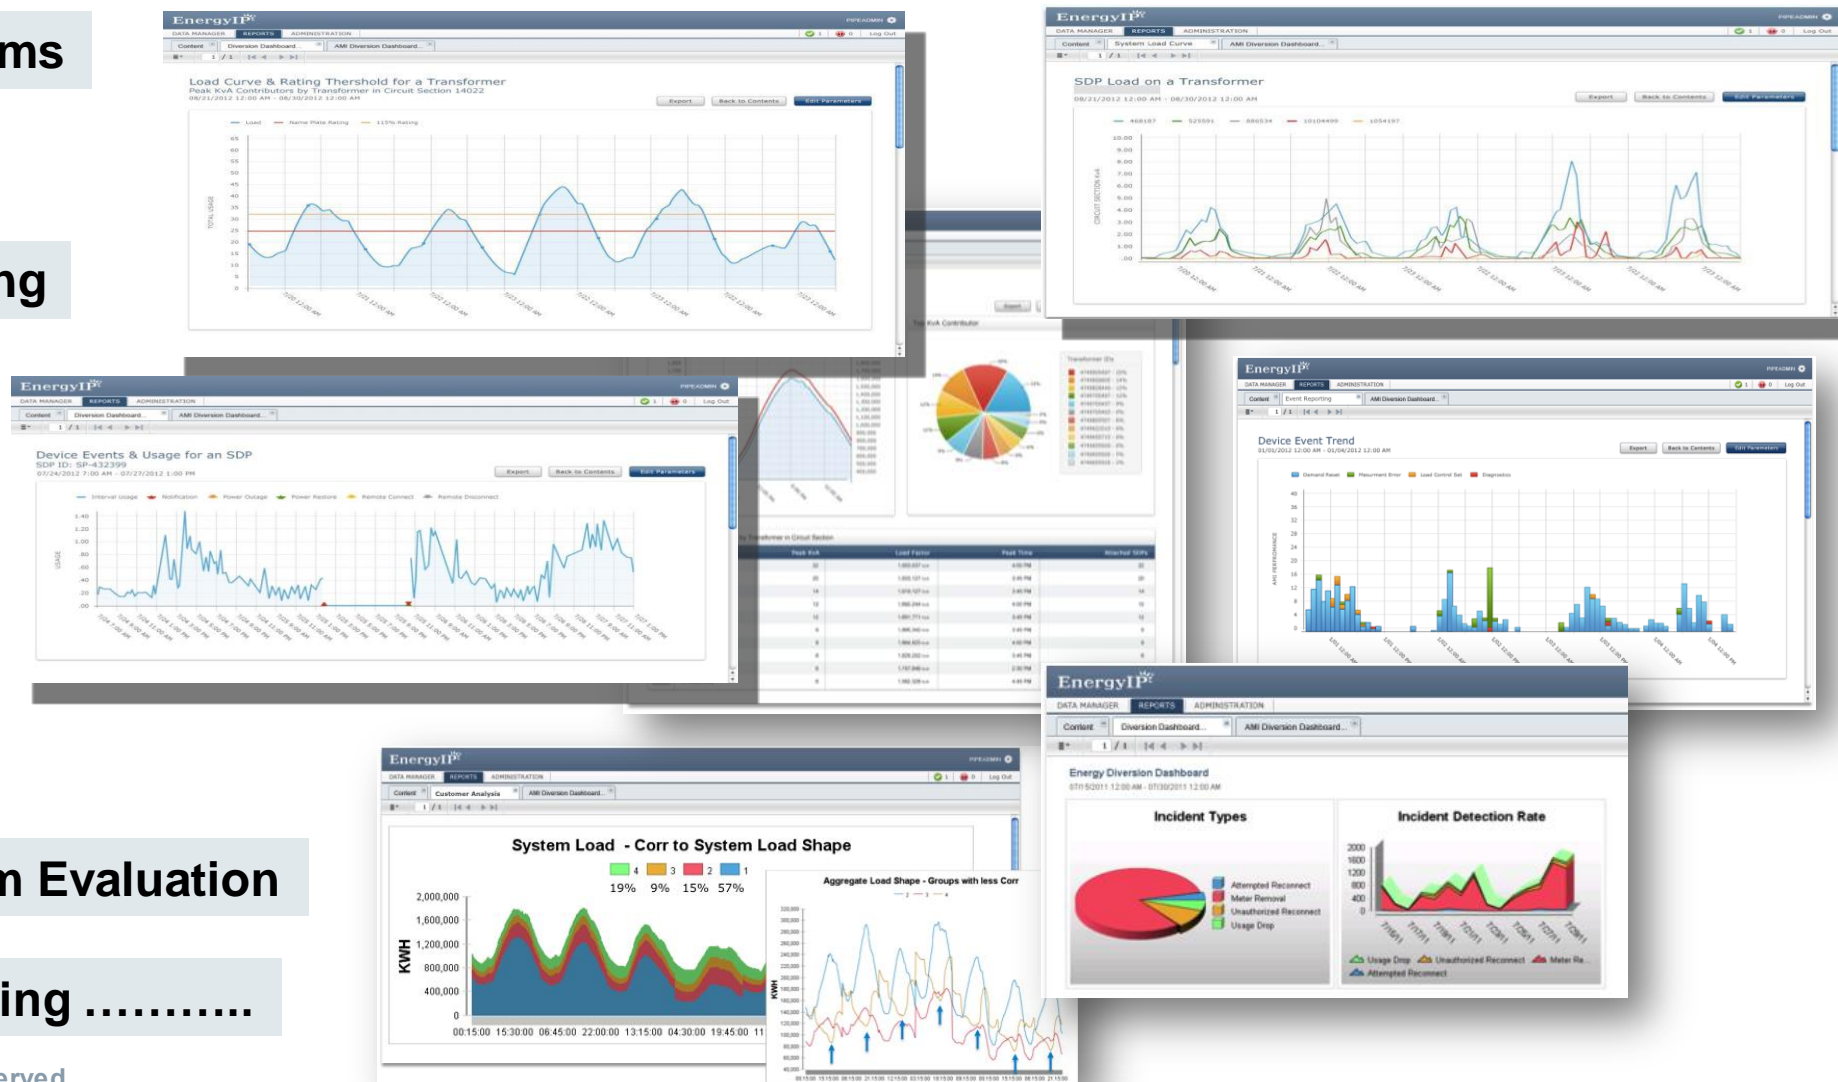

Data Collection Analysis

Grid Loss

Detection of Energy Theft

Demand Response Program Evaluation

Distribution Network Planning

Can we better understand our consumers?

Profiling Load Patterns

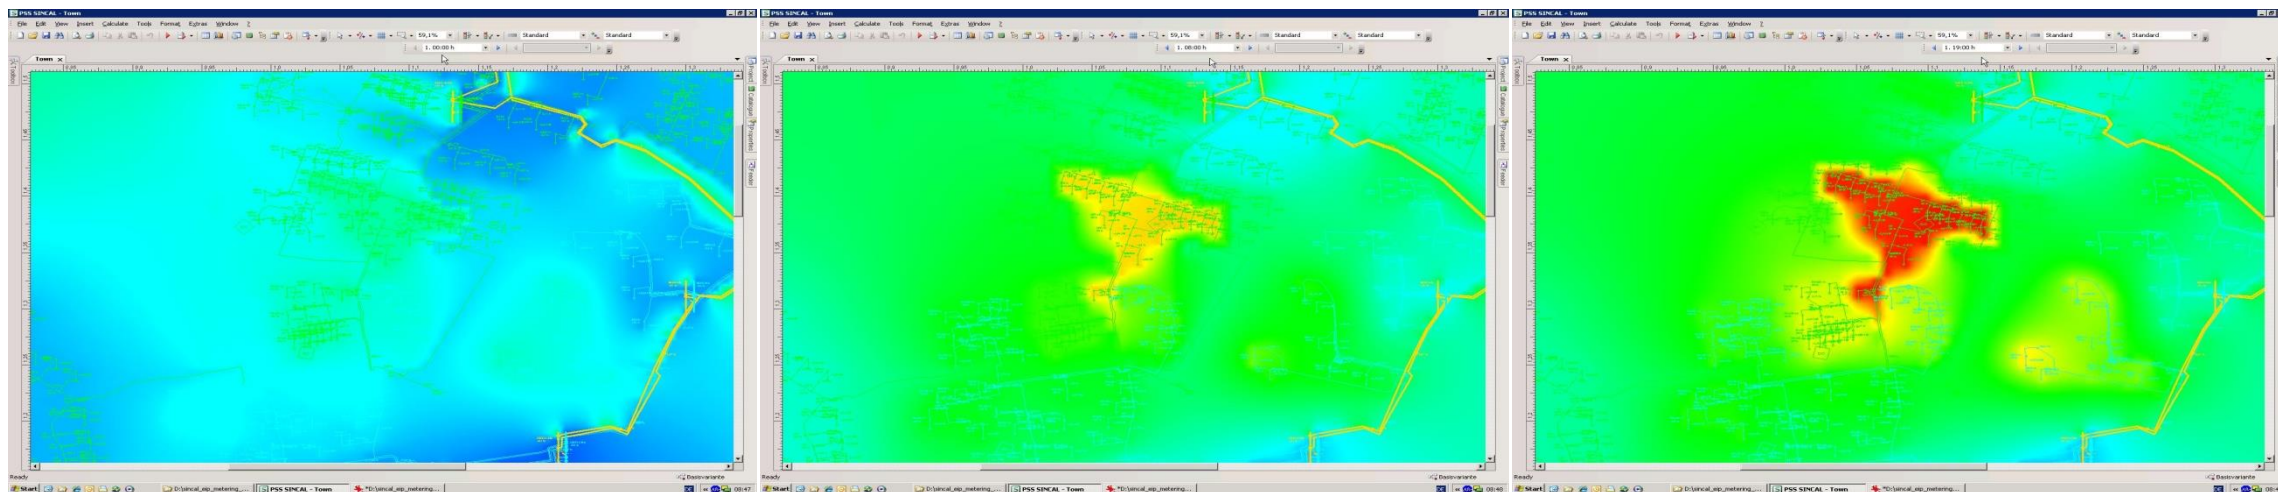

Scenario 1: Long Term Network Planning in PSS®SINCAL via MeterReadService from Energy IP

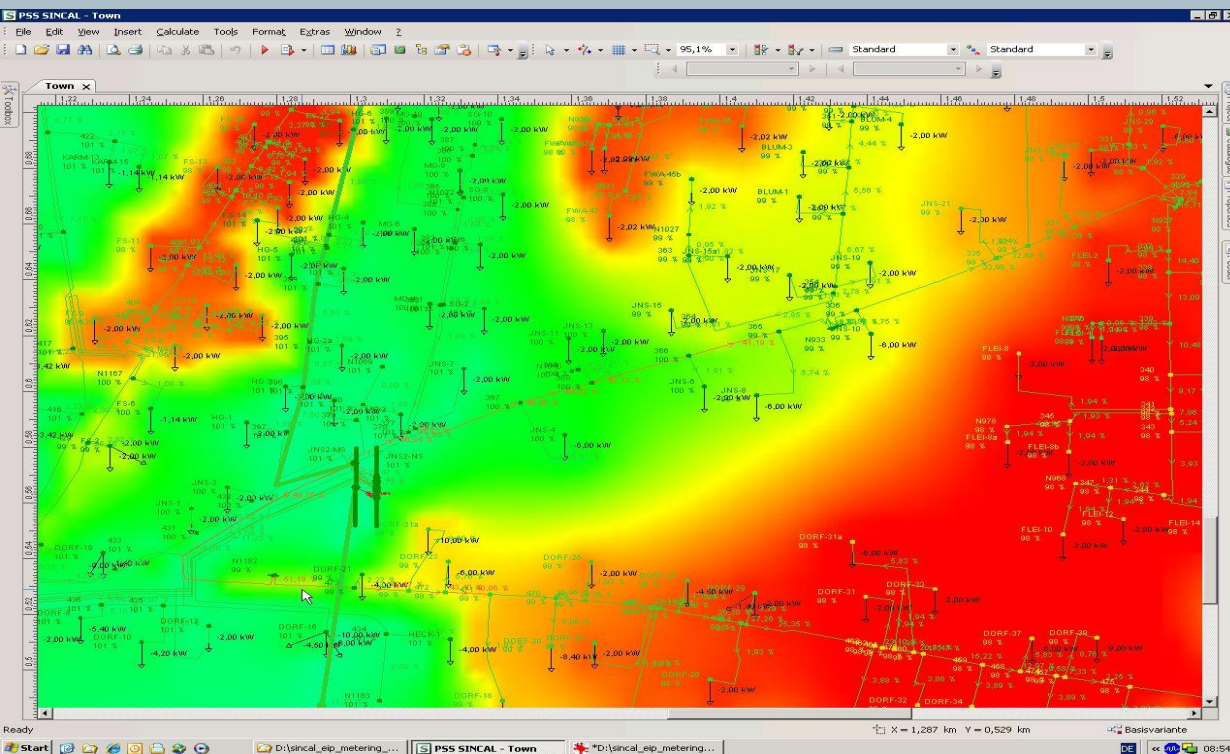

The network simulation gives you results for the loading of the network and for the voltage ranges during the day in every location

SINCAL also provides theme-maps for the whole network e.g. for the voltage at different times

This will lead to optimized network configuration for the future based on reliable evaluations

Scenario 2: Operation Network Planning in PSS®SINCAL via the ActivityGateway of Energy IP

The network simulation gives you results for the loading of the network and for the voltage ranges for the near real time situation

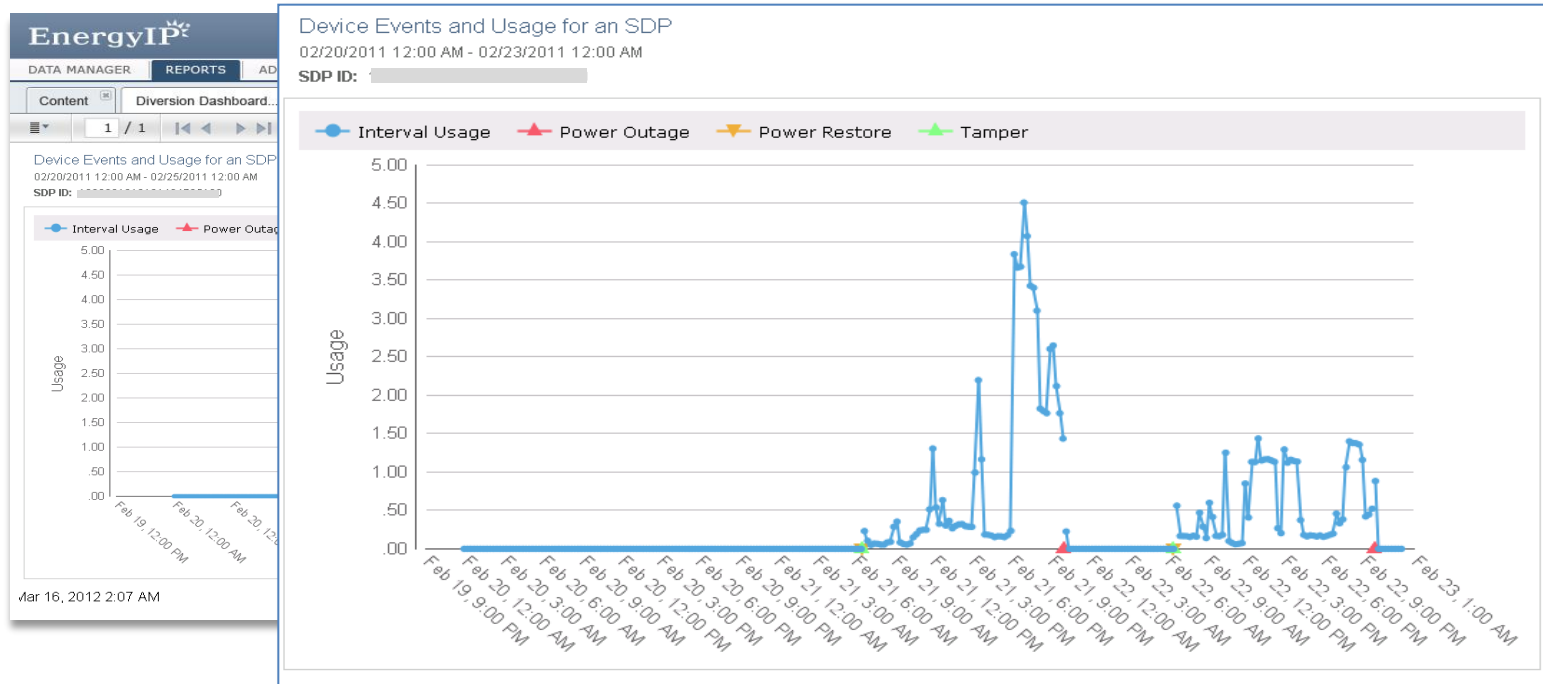

With a suitable network configuration a change of parts of a feeder to an adjacent feeder can optimize generation and losses in the network

Who stole \$6 billion last year?

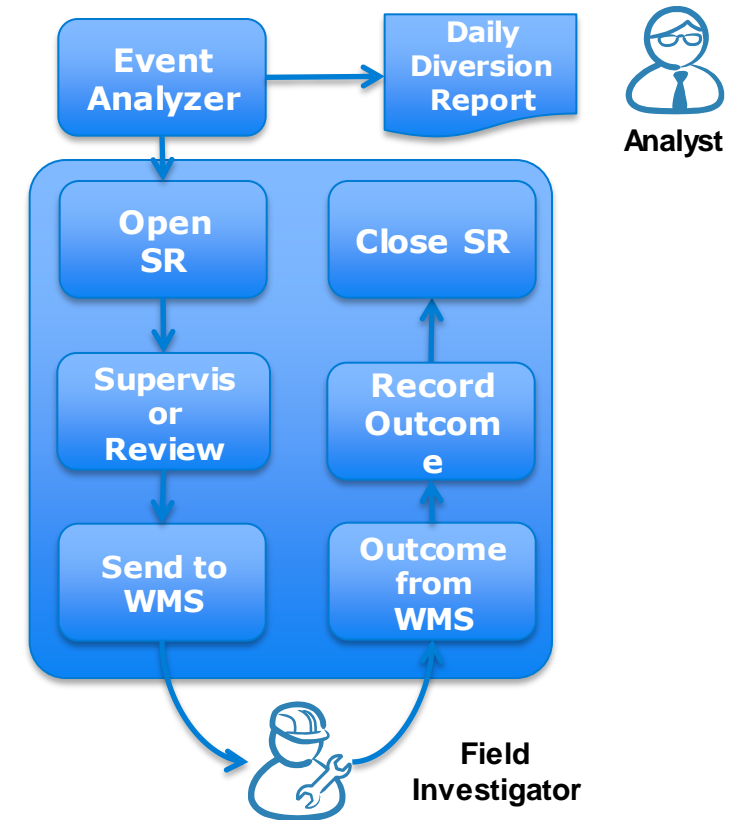

Energy Diversion: Identifying Theft Patterns

Event Chronology

For May 13, 2011 12:00 AM to May 15, 2011 12:00 AM

Transformers fail. But why?

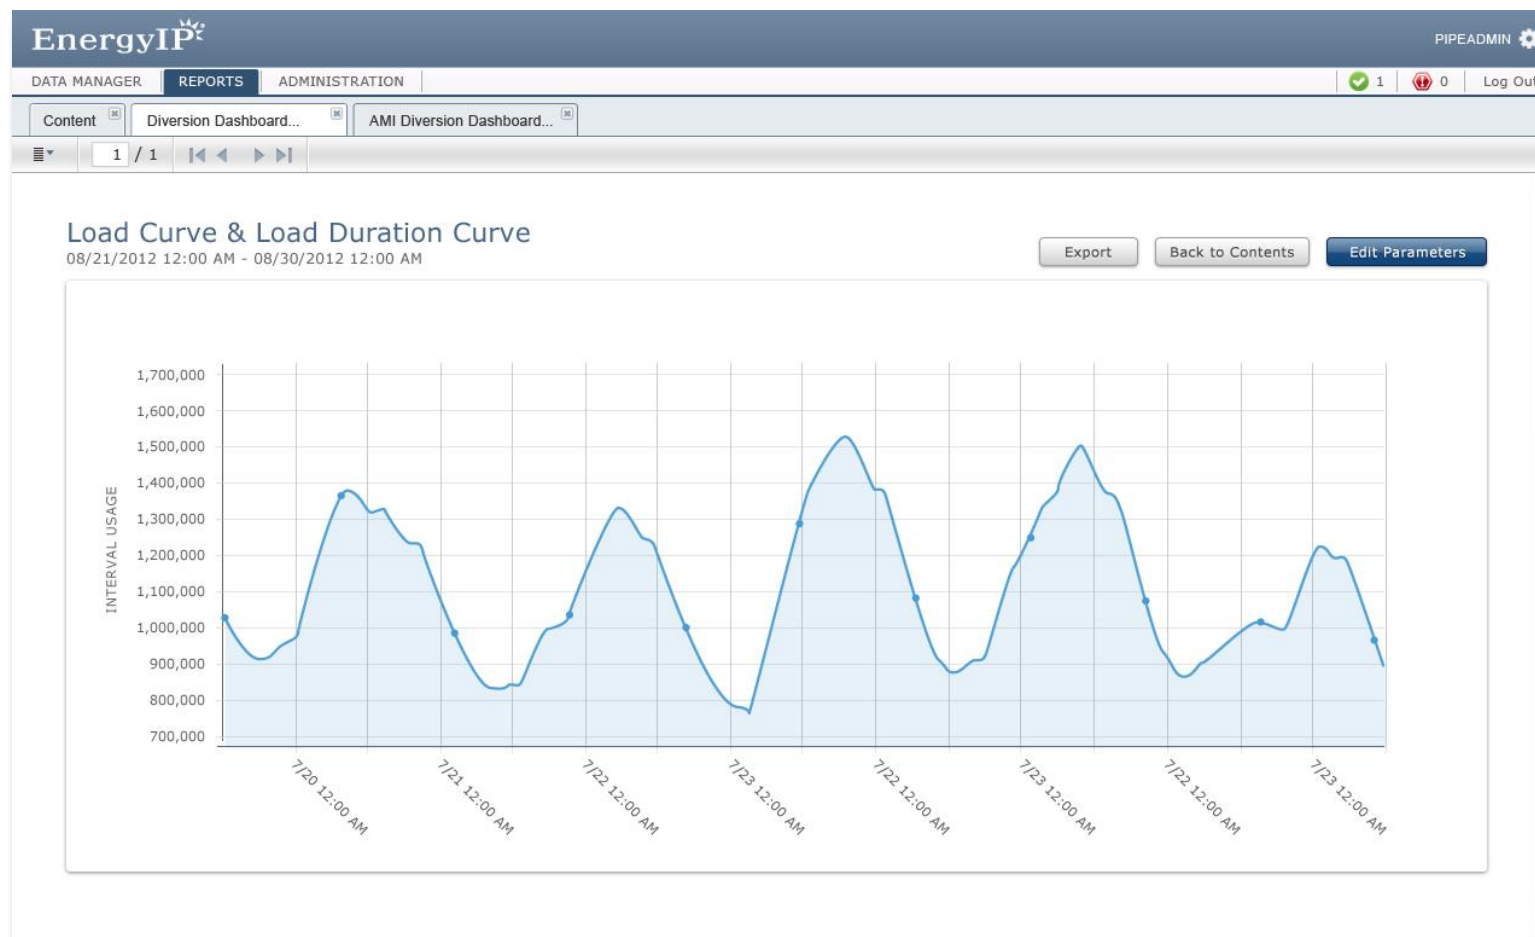

Transformer Overload Tracking Business Process Improvement

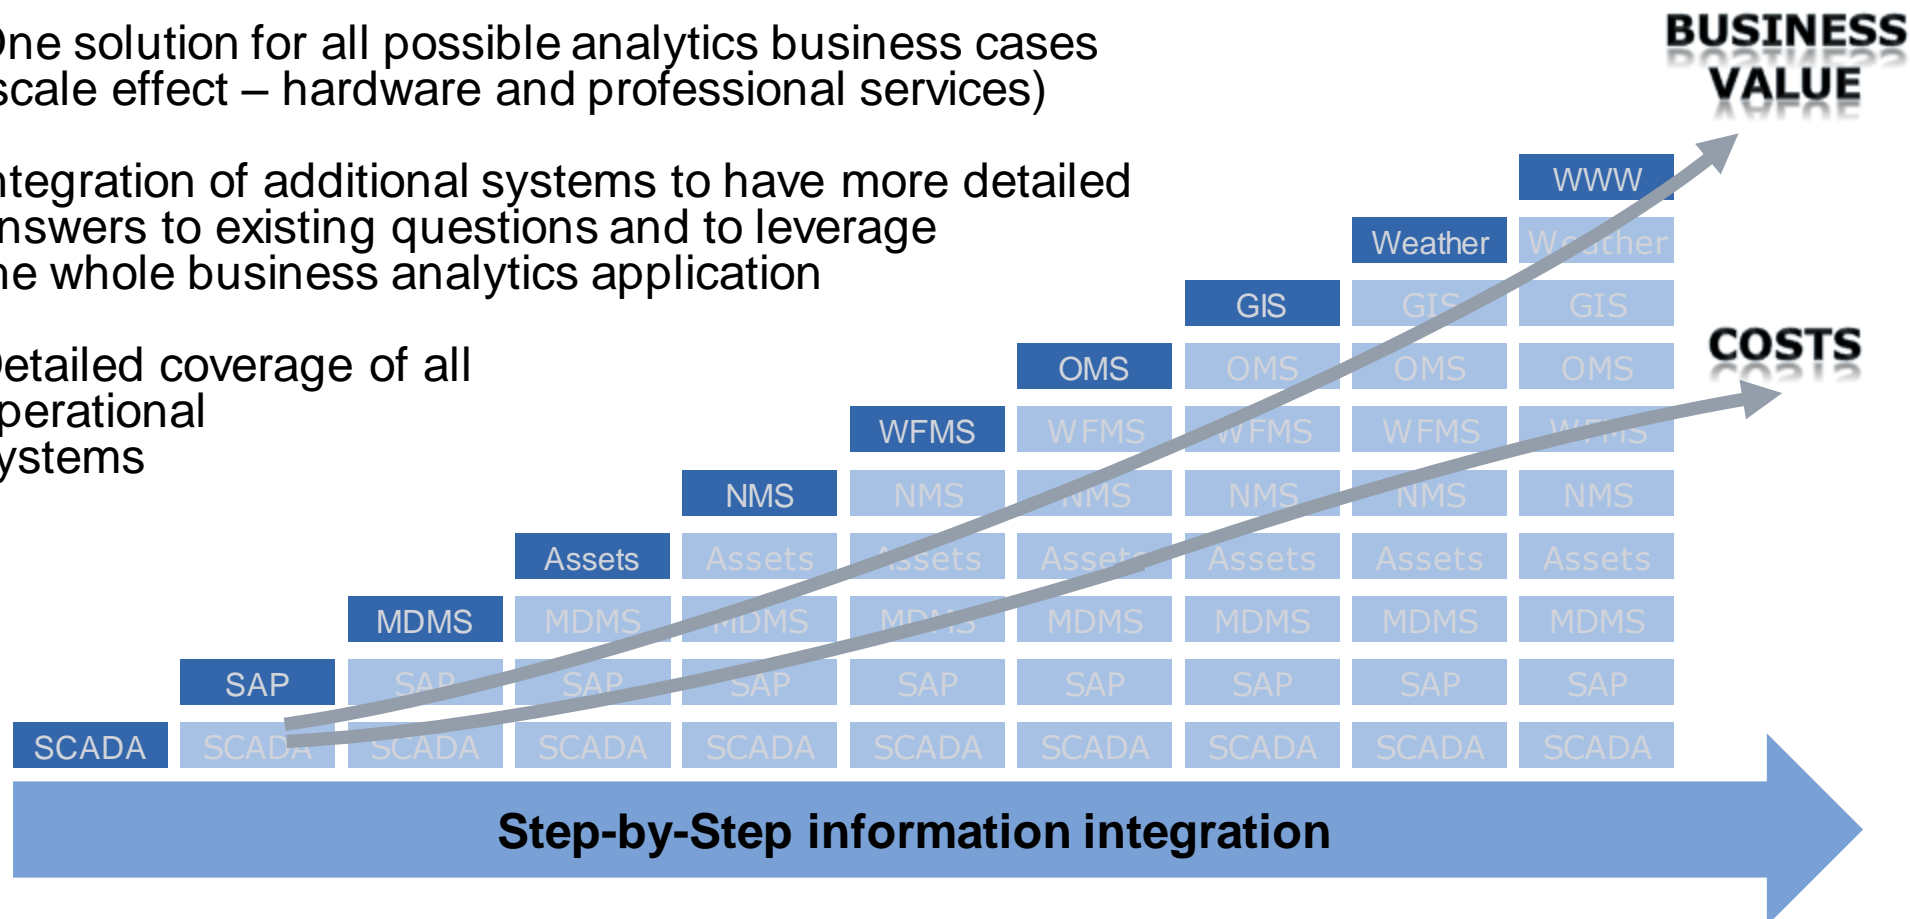

**Operation: 15% of infrastructure is used 1% of time.
What can we do about it?**

System Load

Business value focused implementation

- ▶ One solution for all possible analytics business cases (scale effect – hardware and professional services)
- ▶ Integration of additional systems to have more detailed answers to existing questions and to leverage the whole business analytics application
- ▶ Detailed coverage of all operational systems

Emsdetten, Germany: Integrating renewable power sources into the grid

Monitoring decentralized energy power sources with SICAM MIC und SICAM CMIC

- Reduces grid overloads through controlled infeed
- Stabilizes the grid and power supply
- Maximizes network utilization

We enabled volatile renewable energy sources to be safely integrated into the city's power grid, reducing costs caused by overloads.

Canada: Building Microgrid demonstration project

Microgrid Energy Manager DEMS + SICAM PAS enable

- **Secure & independent power supply for remote communities**
- **Reduce energy costs by replacing diesel-generator through more economic renewables**
- **Showcase for Canada**

With our solution BC Hydro is moving actively implementing Microgrids in Remote Communities along the Canadian west coast in the next years.

Wachtendonk, Germany: Increased grid capacity for the integration of renewable energy sources

Transforming conventional to intelligent substations

- Secures data transmission from the network to the utility's control center
- Increases grid capacity by 35%
- Eliminates the need for grid expansion
- Reduces outage times from hours to minutes

We modernized aging infrastructure and increased grid capacity to intelligently distribute power from renewable energy sources.

Thank you for your attention
